

UFED Cloud Analyzer 7.9

August 2019

First time support for the Snapchat application

Snapchat is a global multimedia messaging app that enables users to share pictures and messages that are only available for a short time before they become inaccessible to their recipients. To date, Snapchat has 190 million daily active users worldwide and more than 400 million Snapchat stories are created per day.

UFED Cloud Analyzer 7.9 introduces first-time support for the Snapchat application, with access using tokens retrieved from any Android device. With this version, you can retrieve backed up files, also known as Memories, and review direct message communications between contacts. Get access to the contact information of the account, and password protected My Eyes Only files.

Note: Extraction of My Eyes Only files from latest Snapchat versions will be supported with token retrieved using later versions of UFED Physical Analyzer

New enhancements with Instagram

This version of UFED Cloud Analyzer introduces comprehensive support for the Instagram application. On top of already supported data sets in previous versions, you can now view responses to posts which include images and videos. You can also get access to all data associated with chat messages including sharing of post/story, likes, comments within a message.

2FA support for Telegram

In this version of UFED Cloud Analyzer you can now overcome two-factor authentication for Telegram. This is the additional security level on top of the code you get in SMS, where users can setup a password that will be required every time they attempt to access their account from a new device.

Solved Issues

- Support for iCloud backup 12.4
- Resolved Google drive extraction issues
- Overcome errors during Google photos extraction
- Partial information received from Google backup of WhatsApp
